Abstract

An interlabial pad individual wrapping container is presented which facilitates sanitarily wearing and removing an interlabial pad between the labia of a wearer. The interlabial individual wrapping container can be used as a preferred handling member at the time of wearing or removing the interlabial pad. Two fingers of the left hand are inserted in the finger insertion openings formed from the belt body attached on the wrapping container; the wrapping container is separated into the sections and along the separation part by opening these fingers to the left and right. While opening the labia by the fingers of the left hand holding the sections, the wearer can fix the interlabial pad, held on the finger of the right hand, in the labia; therefore, the fingers never come in contact with the labia or menstrual blood during the fixing action.
